NOTES SECTION: (attach separate sheet if needed).

Col 2 - The Greater Scaup males were clearly larger, with brighter sides
than the male Lesser Scaup with which they were swimming. There had been
a couple of reports of Greater Scaup elsewhere in the area 3 weeks ago.

Branta bernicla hrota?

Species: Brant Date: April 18 1995

Number: 1 Age: Adult Sex: Male (by behavior)

Locality (Exact information if possible): 4 km NW of Ryley, Alberta, at a pond north of the Canadian National Railway tracks, paralleling Hwy 14.

Time: 1713 → 1910 MDT Length of time observed: approx 35 minutes (1718→1715, 1736→1742, 1835→1910)

Observer: Ross Dickson^{alone} until 1835 MDT, then joined by EM-L

Other Observers: Ed Mah-Lim

Who first saw bird?: DICKSON

Who first identified bird?: DICKSON - A "Black Brant" had been reported here on April 11 1995 by Paul Pryor - using Golden Guide as a reference

Optical equipment used: Bushnell Spacemaster 22X (DICKSON) B+L Elite scope (MAH-LIM)

Distance to bird: 0.5 km when on shore, also it flew twice after 1835 MDT

Weather/light conditions: Partly cloudy, sun behind observers

Was the bird photographed?: No

Comparison species present: Blue & white → Lesser Snow Goose, Ross Goose, Gtr White Fronted Goose, Lesser Canada Goose

Experience with the species: DICKSON - has seen "Black" Brant once, in 1980s, near Vancouver

Voice and /or call notes: NONE HEARD

Was a field guide used while the bird was under observation?: Yes If so how do you think it might have influenced your decision?: Convinced me it wasn't a *Nigrificans* race

Habitat discussion: Prairie slough, maintained by Ducks Unlimited

Behavior: Alert, paired (or trying very hard to be) with a Lesser Canada Goose female

Are you 100% certain of the identification?: Yes Are others 100% certain: MAH-LIM agrees it didn't look like Black Brant.

How were similar species eliminated?:

Black head without chin strap eliminates Canada Goose, Overall dark

appearance & black legs eliminates "Blue Goose" or White Fronted Geese, this is

the only goose with a white neckband stripe on a dark neck.

DESCRIPTION: Write a detailed description. If you are not familiar with all of the terms used to describe a bird see your field guide topography page and try to describe each part of the unusual bird. Get as much information down as possible as to shape, colour, patterns, unique features, etc. SKETCH the bird and show as much detail as possible.

Brant Goose

April 18

Small goose, about 90% of bulk and shorter than a female Lesser Canada Goose with which it was paired. Glossy dark brown/black (depending on the light) head + bill and neck and upper breast. There was a clearly defined border between the neck and the matte dark brown back. Also a clear border between the upper breast and a "dirty" brown area of the breast which then changed to a dirty white (or mottled) large patch on the side. There was a white vent area bordered by black tail feathers. Legs were dark or black.

associated mostly with a Canada Goose about 90% of its bulk
first seen 1715-1715 MDT
then 1736-1742 MDT
- it walked out along shoreline
resighted 1835 and walked until 1910 MDT

The necklace was prominent white on each side of the neck, just below the head, but it did not meet at the front of the neck. In flight, Brant showed a prominent white V on the tail, compared with a U on the Canada.

Behavior - Goose walked erect, almost nervously with complete attention to the female Canada Goose he was with. Whenever she walked, he was nearby. When she flew, he was never more than 2-3m away. She occasionally used twisting, almost evasive flight manoeuvres and he stayed close by. Another Canada tried to attack the Brant in flight but he seemed only to evade rather than retaliate so as to maintain contact with the female. She also did not appear to be relaxed. These two were segregated by behaviour and movements from a small flock of Lesser Canadas (8-10) which were more interested in feeding in a nearby stubble field. A flock of 1500 Snow Geese and 50 Ross + 50 White-fronts were swimming in the slough. These 2 birds spent all their non-flying time on the shoreline. They did not eat or preen. Perhaps the pairing wasn't yet complete and he was still trying to win her attention. When the other geese were frightened off by an approaching helicopter, these two continued to walk along the shoreline.

General Impression - Refer to "Waterfowl" by S. Madge + H. Burn p. 40-41. This bird was close to figure 25a, although the striped side was about as light as for 25c.

UPDATE
April 21 1800 MDT - The Brant + its mate were seen by me in the company of about 300 Lesser Canadas + 1810 and about 300 White-fronted Geese at the same location. All of these birds were swimming. The Brant has apparently been seen Wednesday + Thursday here by Brian Ritchie but has been missed by several birders. This may only be a resting location. Brian saw it fly in (with the Canada) from a nearby field on April 20.

Behavior: BIRD FLEW INTO AN ASPEN BRANCH; POCKET ABOUT SOMEWHAT ALONG

Are you 100% certain of the identification?: YES Are others 100% certain: —

How were similar species eliminated?: Main confusion species present was warbling vireo (there were quite a few there) but pale long patcher immediately drew suspicion that this was not one of those. Bird partially facing, rounded forehead (warbling vireo's crown somewhat peaked with crown darker than cheeks), and buffy breast and flank eliminated that. (But immature warbling vireo have yellowish flanks, some have some buff on lower flank, still fewer have almost completely buffy flanks. I have never seen a warbling vireo with buffy breast and flank). Only other possible confusion species - eastern warbler? Generally is blue with two wing bars. That species does not wander.

All key field marks were noted as in above diagrams. Figure 1 was my first view of the bird as it alit on an aspen branch. I noted the pale wing patches as it landed then was able to see the head in profile as in figure 2. As the bird moved up the branch a few feet, it turned somewhat to its right allowing me a perfect view of the head again and the buffy ~~underparts~~ ^{breast} and flanker. The bird then flew further westward to the next aspen.

This gull was about the size of a Ring-billed Gull. One of the most immediately noticeable things about the bird were the relative broadness of the tertial, greater covert, lesser covert, and scapular feathers in relation to those of other gulls. These feathers were illuminated probably by the fact that they were all outlined with a perfectly-defined white trim although there was a hint of the beginning of some barring on the outer greater covert. Primaries were blackish with narrow whitish accents on the tips. Base tertial and greater covert colour was blackish, but colour up the median and lesser covert to the scapula seemed to be a mixture of black with a sort of pale reddish brown (but, again, these feathers were mostly trimmed in white as well and had some degree of barring, forming a central vertical shaft up each feather. The median

was very densely blackish, seeming almost stretched horizontally and vertically. Tail had a very broad blackish band but base of tail rump and abdomen were snow white with fine, but lengthy, blackish bars crosswise. The tail was tipped very narrowly white. Legs were flesh-colored. Upper beak rather finely streaked dusky. Head relatively whitish except for "squint" smudging around eye. Very faint smudging prominent on ear coverts. Bill blackish and at least as long as a Ring-billed Gull's bill but a little thicker.

There may have been a small point at base of lower mandible or this may have been feathers (this was not clear). I believe the state of the head plumage and other character in relation to feet that scapulars did not have as much of black as greater coverts, and tertials (somewhat sooty but not completely) mean that the bird had moulted somewhat into first winter plumage.

How were similar species eliminated?: Size eliminated Ring-billed Gulls, Brown Pelicans, actually limited further identification to Herring's or Slaty-backed Gull. Immature Herring's have brownish bills which pale with age. This gull had an obviously almost blackish tail and must, therefore, have been a first-summer or second-winter Slaty-backed Gull. According to "Gull's" Slaty-backs don't achieve any degree of the "slaty" mantle until well into second-summer plumage.

Myself and another observer (Penny Smith) were standing by the road when I noticed this big gull flying towards us from downriver. I remarked on its heavy build. The bird passed by not more than 25 yards away in perfect lighting conditions and I had great looks at the upperwing, part of the underwing, mantle, head, and eye. The bird was very pale. Mantle, scapulars and all upperwing secondary coverts were sort of dirty white with brown flecks. Outer primaries were a beautiful solid brown (not the same tone as Hager's wicks). Secondary were slightly paler than the primaries with pale tips slightly worn. Greater secondary coverts were slightly paler than secondaries, again with slightly worn tips and sides. These feathers seemed unusually long, maybe even being longer

than the secondaries. Remainder of upperwing and mantle, scapulars and head were sort of a dirty white with brown flecks. Eye was a pale reddish brown and seemed very considerably small unlike anything I had seen before in a gull. I am theorizing that it was "paling" from brown to yellow accounting for the unusual shade. Structure of the eye socket seemed different from anything I had seen around here (at least a short look as the bird flew by). Underwing primaries had only 3 outermost primaries being brown. Bill was extensively pale at base with dark tip then seemed to be paling from the tip (completely dark at bill could not be obtained but these features I am certain). Tail (seen while the bird was resting on a gravel bar) was almost blackish and contrasted with pure white wings. Unlike most gulls, tail feathers seemed vertically coloured rather than horizontally across the feathers. At this point, the bird's size compared to Herring Gull, dwarfing all nearby Ring-billed Gulls.
